

# InView Mobile Data

InView Mobile is a mobile application that delivers user-definable content to iOS and Android smartphones and tablets. InView Mobile Data is an extension of the product that focuses on delivering real-time data within the context of the InView Mobile Application.

The scope of the information that InView Mobile delivers is real-time, logic driven data from an SES server. Popular data sources are IVR/ACD systems, trouble ticketing systems, schedules, warehouse management systems, and anything else with data that can be collected by a Symon server. It can also include text and image-based company messages for Employee Communication to deliver company or department news, images or anything else your content editors wish to communicate.

Once the InView Mobile Data package is installed on a Symon server, all of the content editing can be managed by an editor on your corporate network through an easy to use web editor.

That content can then be accessed by any mobile device with the secret search code and VPN access to your network. None of the collected data ever leaves.

For more information on InView Mobile Data, contact your local Symon account representative. Call 800.827.9666 or email Symon at sales@symon.com.
